

Problem C. Ghorir Kata

Time limit 1000 ms

Mem limit 262144 kB

There is a clock labeled with the numbers 1 through 12 in clockwise order, as shown below.

In this example, $(a, b, c, d) = (2, 9, 10, 6)$, and the strings intersect.

Alice and Bob have four **distinct** integers a, b, c, d not more than 12. Alice ties a red string connecting a and b , and Bob ties a blue string connecting c and d . Do the strings intersect? (The strings are straight line segments.)

Input

The first line contains a single integer t ($1 \leq t \leq 5940$) — the number of test cases.

The only line of each test case contains four **distinct** integers a, b, c, d ($1 \leq a, b, c, d \leq 12$).

Output

For each test case, output "YES" (without quotes) if the strings intersect, and "NO" (without quotes) otherwise.

You can output "YES" and "NO" in any case (for example, strings "yEs", "yes", and "Yes" will be recognized as a positive response).

Examples

Input	Output
15	YES
2 9 10 6	NO
3 8 9 1	NO
1 2 3 4	YES
5 3 4 12	YES
1 8 2 10	NO
3 12 11 8	NO
9 10 12 1	NO
12 1 10 2	NO
3 12 6 9	NO
1 9 8 4	NO
6 7 9 12	YES
7 12 9 6	YES
10 12 11 1	YES
3 9 6 12	YES
1 4 3 5	YES

Note

The first test case is pictured in the statement.

In the second test case, the strings do not intersect, as shown below.
